Driving License Issuance Service – Absher Platform

Imam Mohammad Ibn Saud Islamic University
College of Computer and Information Sciences

Information Systems Department

Course Title : Enterprise Architecture
Course Code : IS 1310
Course Instructor : Dr. Hala Al-Mutair

Introduction

Driving License Issuance Service – Absher

- E-government transportation service in Saudi Arabia.
- Allows users to issue driving licenses digitally.
- Integrates with medical centers, insurance providers, and driving schools.
- Supports Saudi digital transformation initiatives.

Problem Statements

Problem 1

Lack of real-time synchronization between external systems and Absher.

Results

- Delays in updates
- Pending requests
- Slow verification process

Problem 2

Limited transparency during the application process.

Results

- Users cannot clearly track application status.
- Uncertainty about next steps and waiting time.

EA Framework

Selected Framework: TOGAF Why TOGAF?

- Supports As-Is and To-Be analysis.
- Improves integration between systems.
- Aligns business and IT processes.

Strategic Alignment

01

Vision

Provide an integrated and efficient digital driving license issuance service.

02

Mission

Simplify and automate the license issuance process through secure system integration.

03

Values

Transparency
Efficiency
Reliability
User Satisfaction

Strategic Alignment

04

Objectives

- Improve real-time system integration.
- Reduce delays in verification processes.
- Enhance user experience and process transparency.

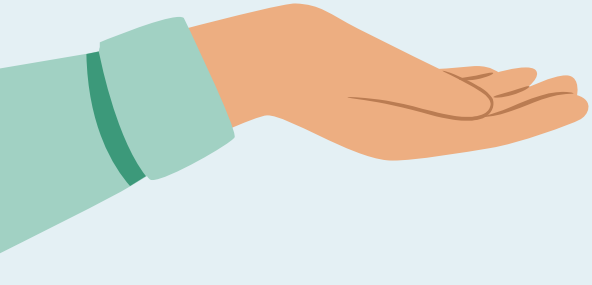

05

Service scope selection

Transportation E-Government Service
The service belongs to the transportation and public digital services sector.

Current Process Analysis (As-Is Situation)

01

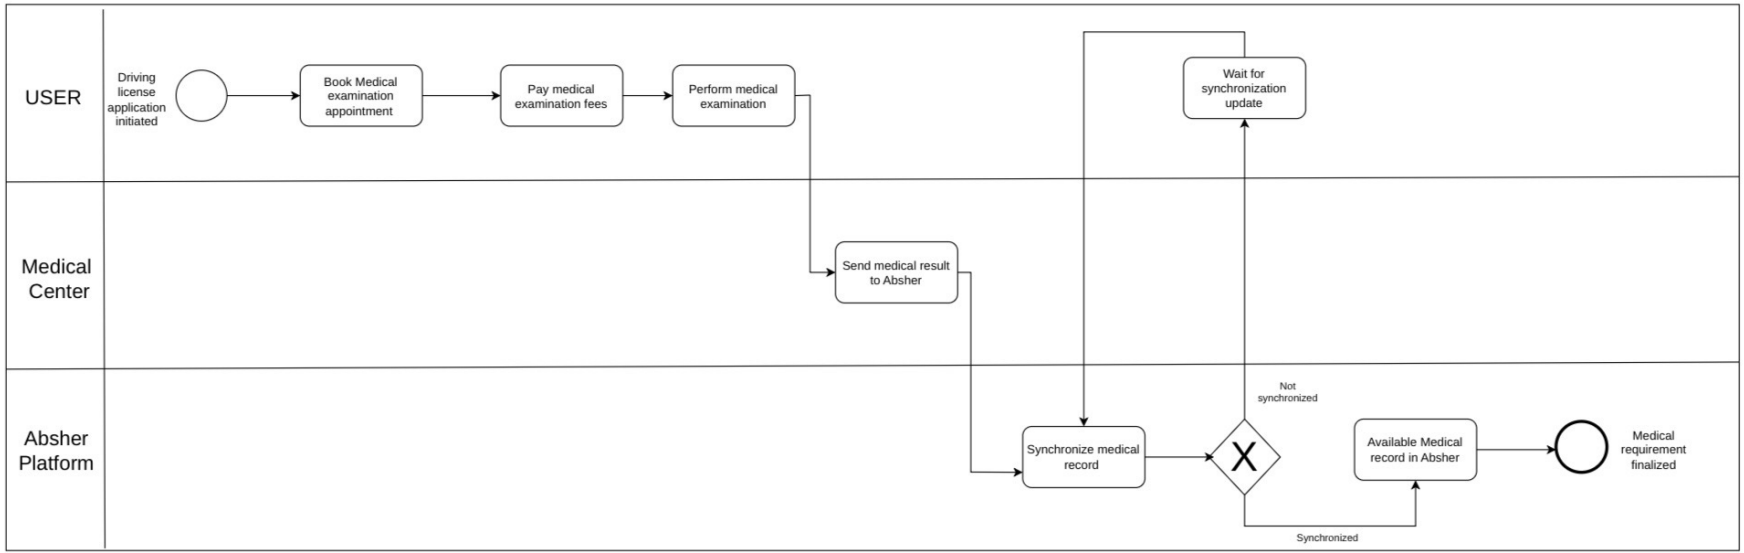

Description of the Current Situation 1:

The current driving license process depends on external medical systems to verify users' medical records before the practical driving test. However, the systems are not fully synchronized with Absher in real time, which may cause delays in updating medical records. As a result, users repeatedly check the system for updates, creating uncertainty and reducing process efficiency.

01

Process Modelling: ‘As-Is’ BPMN Diagrams 1:

02

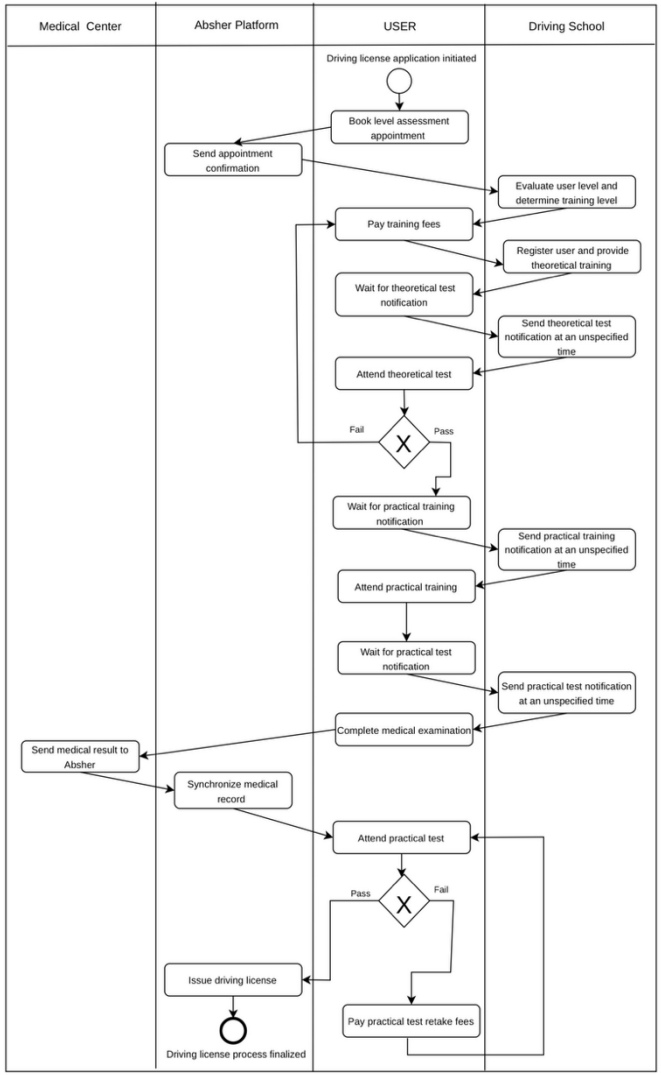

Description of the Current Situation 2:

Limited Inquiry Feature: The current status tool is basic and does not provide a full picture of the application

Manual Follow-up: No automated notifications are sent; users must log in and check multiple steps manually to find updates **Customer Responsibility:** The system does not take initiative, putting the entire responsibility of tracking on the customer.

Unclear Timelines: Users are not informed about how long each stage will take or when their request will move forward.

Process Modelling: 'As-Is' BPMN Diagrams 2:

02

03

Gap Analysis Template and Justification :

- Easy comparison between the current and future process.
- Helps identify the main gaps in the service.
- Provides clear improvement actions.
- Focuses on improving user experience and process efficiency.

Criteria	Current state	Future state	Gap	Close gap
Medical Record Synchronization	External systems (Medical/Insurance) are not linked in real-time with Absher.	All systems are fully connected, and data is updated instantly.	Why is there a delay? Because the data transfer between clinics and Absher is slow.	Improve the digital link to make sure medical results appear immediately.
Process Visibility	Users cannot track their application status or see what happens next.	A simple dashboard that shows users exactly where they are in the process.	Why is it hard to follow? Because the platform lacks a clear progress bar or notifications.	Add a "Track My Application" feature and send automatic status alerts.
Waiting Time Transparency	Users don't know how long each step (like training or testing) will take.	A simple dashboard that shows users exactly where they are in the process.	Why is there uncertainty? Because the system doesn't show the expected duration for each step.	Provide estimated times for every stage and notify users about upcoming steps.

04

Highlighting the Changes for Improvements:

Current Situation 1

- Improve integration between Absher and medical systems.
- Enable automatic medical record synchronization.
- Reduce manual checking by users.

Current Situation 2

- Add dashboard for process tracking.
- Show current stage and next step clearly.
- Send automatic notifications and reminders.
- Display expected waiting time for each stage.

05

Process Improvement Opportunities:

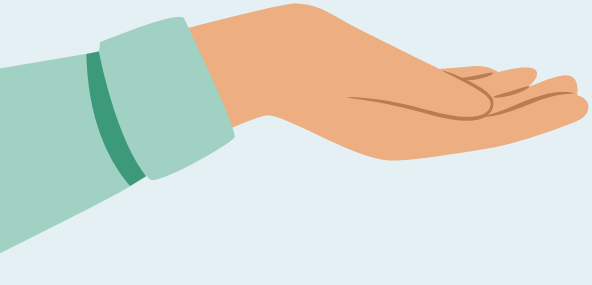

Current Situation 1: Opportunities for improvement include reducing delays in medical record updates, improving integration between medical systems and Absher, and reducing repeated manual checking by users.

Current Situation 2: Opportunities for improvement include improving process visibility, enhancing communication between users and driving schools, and providing clearer progress tracking and waiting time updates.

Proposed Future Process (To-Be Situation)

01

Description of the ‘To-Be’ Business Process 1

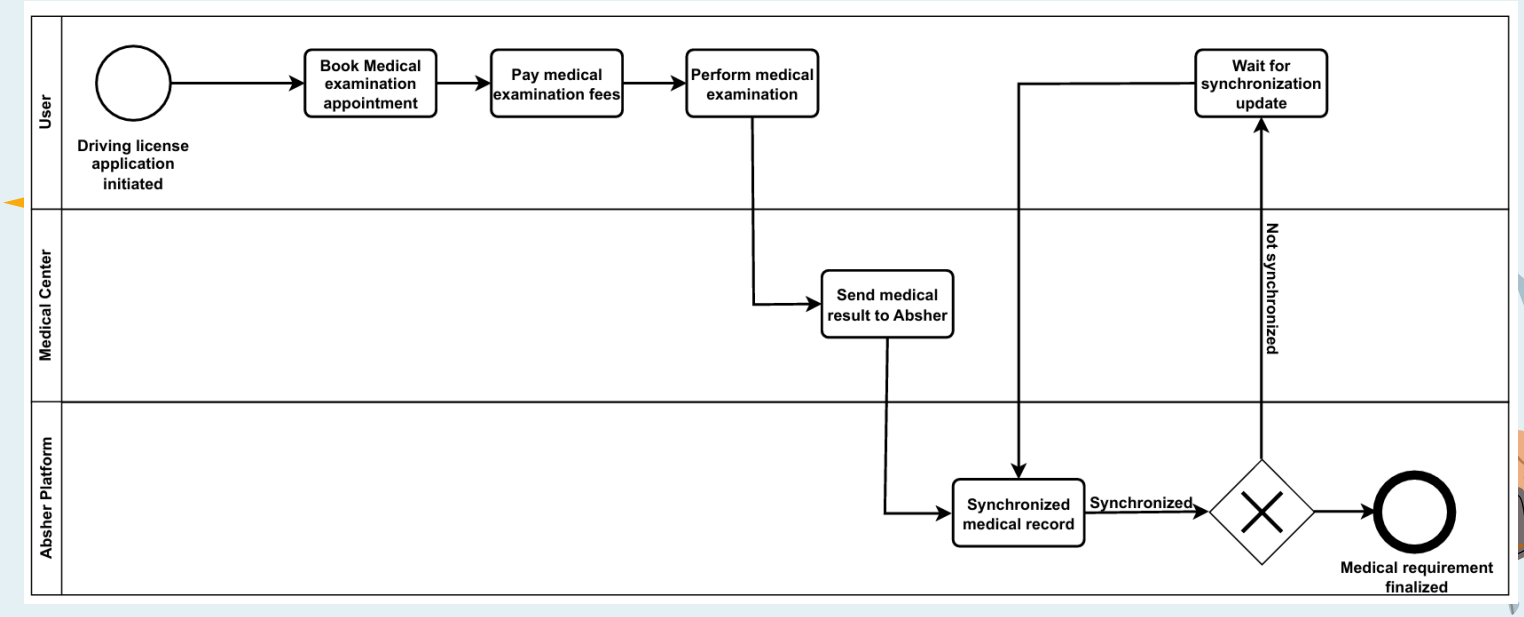

The current process relies on external medical systems that are not synchronized with Absher in real-time. This lack of integration causes delays in updating medical records, forcing users to check the system repeatedly and reducing overall efficiency."

To-Be Solution: Integrated Real-Time Sync"The improved process establishes a direct API integration to enable instant data exchange. By automating validation and submission, results are updated immediately without manual follow-ups. This ensures a seamless, system-driven workflow that eliminates waiting times.

01

Process Modelling: ‘To-Be’ BPMN Diagram 1

02

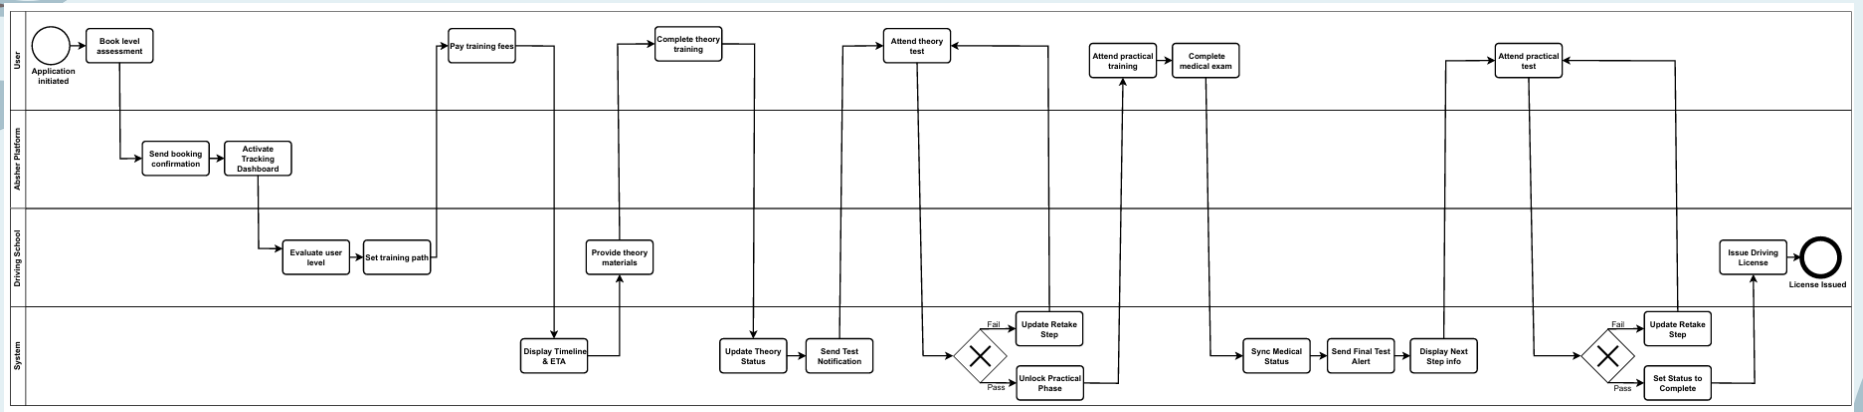

Description of the ‘To-Be’ Business Process 2

The proposed To-Be Business Process 2 improves the driving license issuance process by adding automation, dashboard tracking, and better communication between users and related entities. The system provides real-time updates, automatic notifications, and clear visibility of the current stage and upcoming steps.
