summary

As the telecom sector grows under Vision 2030, customer loyalty is crucial for STC. Current training is long, expensive, and doesn’t create realistic pressure

Using VR simulation can shorten training time, cut costs, and prepare employees better for real customer situations

The report ends with key recommendations for implementing this solution

Introduction

The Saudi telecom sector is undergoing major transformation under Vision 2030
The company aims to become customer-centric, relying heavily on the competency of Customer Service Representatives (CSRs)
Current training is based on classrooms and human role-play, which is costly, slow, and lacks psychological realis

Problem & Purpose

Main Problem: The current training process is inefficient and not realistic enough

Purpose of the report: Propose a VR Simulation solution to reduce training time and cost
.while providing realistic

Introduction

Scope & Limitations

Scope: Focus only on improving interpersonal skills (empathy, conflict resolution, stress management).
Technical training is not included.

Limitations: Financial data was not accessible due to privacy policies, so the analysis relies on public information, academic studies, and our own surveys/interviews

Introduction

Methodology

Secondary Research: Reviewed academic papers about STC's shift toward customer focus

Primary Research:
Conducted a structured interview with an STC Customer Service Supervisor → revealed the 3-month training period and use of actors
Online survey with 21 CSRs → over 75% showed interest in VR training solutions

Introduction

Target Audience

LEARNING AND DEVELOPMENT TEAM

HUMAN RESOURCES AND SENIOR MANAGEMENT

CUSTOMER SERVICE MANAGEMENT

problem statement

CURRENT TRAINING STRUCTURE

Identified Problems

- Simulation is not fully realistic.
- Limited scenario variety + limited actors.
- Insufficient repetition → weak skill reinforcement.
- No personalized training paths.
- Trainee skill levels differ but training is uniform.
- Not enough preparation for unpredictable situations.

Gap Analysis

Focus Areas

1. Scenario repetition
2. Realism
3. Trainee-specific skill development
4. Flexibility in practice

Desired State

- Repetition of complex scenarios with different customer types
- Progressive difficulty (simple → high-pressure)
- Continuously updated scenarios
- Flexible access based on trainee pace
- Personalized training based on individual skill gaps

Gap Analysis

Gaps Identified

- Repetition Gap: Cannot repeat scenarios enough
- Scenario Diversity Gap: Limited customer types, languages, cultures
- Stress Simulation Gap: Limited controlled high-stress practice
- Flexibility Gap: Fixed schedules, low individual access
- Individual Training Gap: Minimal personalization for skill differences

Action Analysis

Traditional options like increasing simulations or relying on more e-learning don’t solve the problem—they’re costly, limited, and fail to deliver real-world pressure. VR stands out as the best solution because it enables unlimited repetition, progressive difficulty, a wide range of scenarios, high realism, personalized training based on each trainee’s performance, precise performance tracking, and scalability as company needs evolve.

Pros: realistic practice, faster learning, fewer errors, unlimited repetition, higher confidence, and precise evaluation.
Cons: high initial cost, possible discomfort, needed updates, tech issues, infrastructure needs, and staff training.

Procedures

DEFINE RESEARCH FOCUS

Assess repetition, realism, trainee skill development, and flexibility in STC training

DESIGN DATA COLLECTION TOOLS

-Employee survey on realism, confidence, and openness to VR
-Semi-structured interview questions to capture training issues and limitations

COLLECT PRIMARY DATA

-Distribute surveys to customer-service staff
-Conduct interviews in STC branches for detailed insights into real training practicesf

ANALYZE COLLECTED DATA

-Identify trends in readiness and scenario realism
-Review interview responses for constraints and effectiveness of current methods

INTEGRATE FINDINGS & IDENTIFY GAPS

,Summarize gaps: limited repetition, lack of stress simulation low scenario diversity, and weak personalization

PROPOSE VR SOLUTION

VR design: realistic immersion, unlimited practice, progressive difficulty, and adaptive scenarios based on trainee needs

Methods & Approaches

Data Collection

- Survey (21 trainees) → effectiveness, realism, confidence, and VR openness.
- Interviews (2 staff) → program structure, scenario use, limitations.

How the Problem Was Studied:
First, the current training was evaluated: it's realistic and diverse but limited in repetition, scenario variety, and time efficiency. Next, survey results were compared: trainees wanted more practice, scenario updates, and support. Finally, these gaps were matched with VR capabilities, which provide unlimited repetition, flexible scenario variation, controlled stress, and continuous updates.

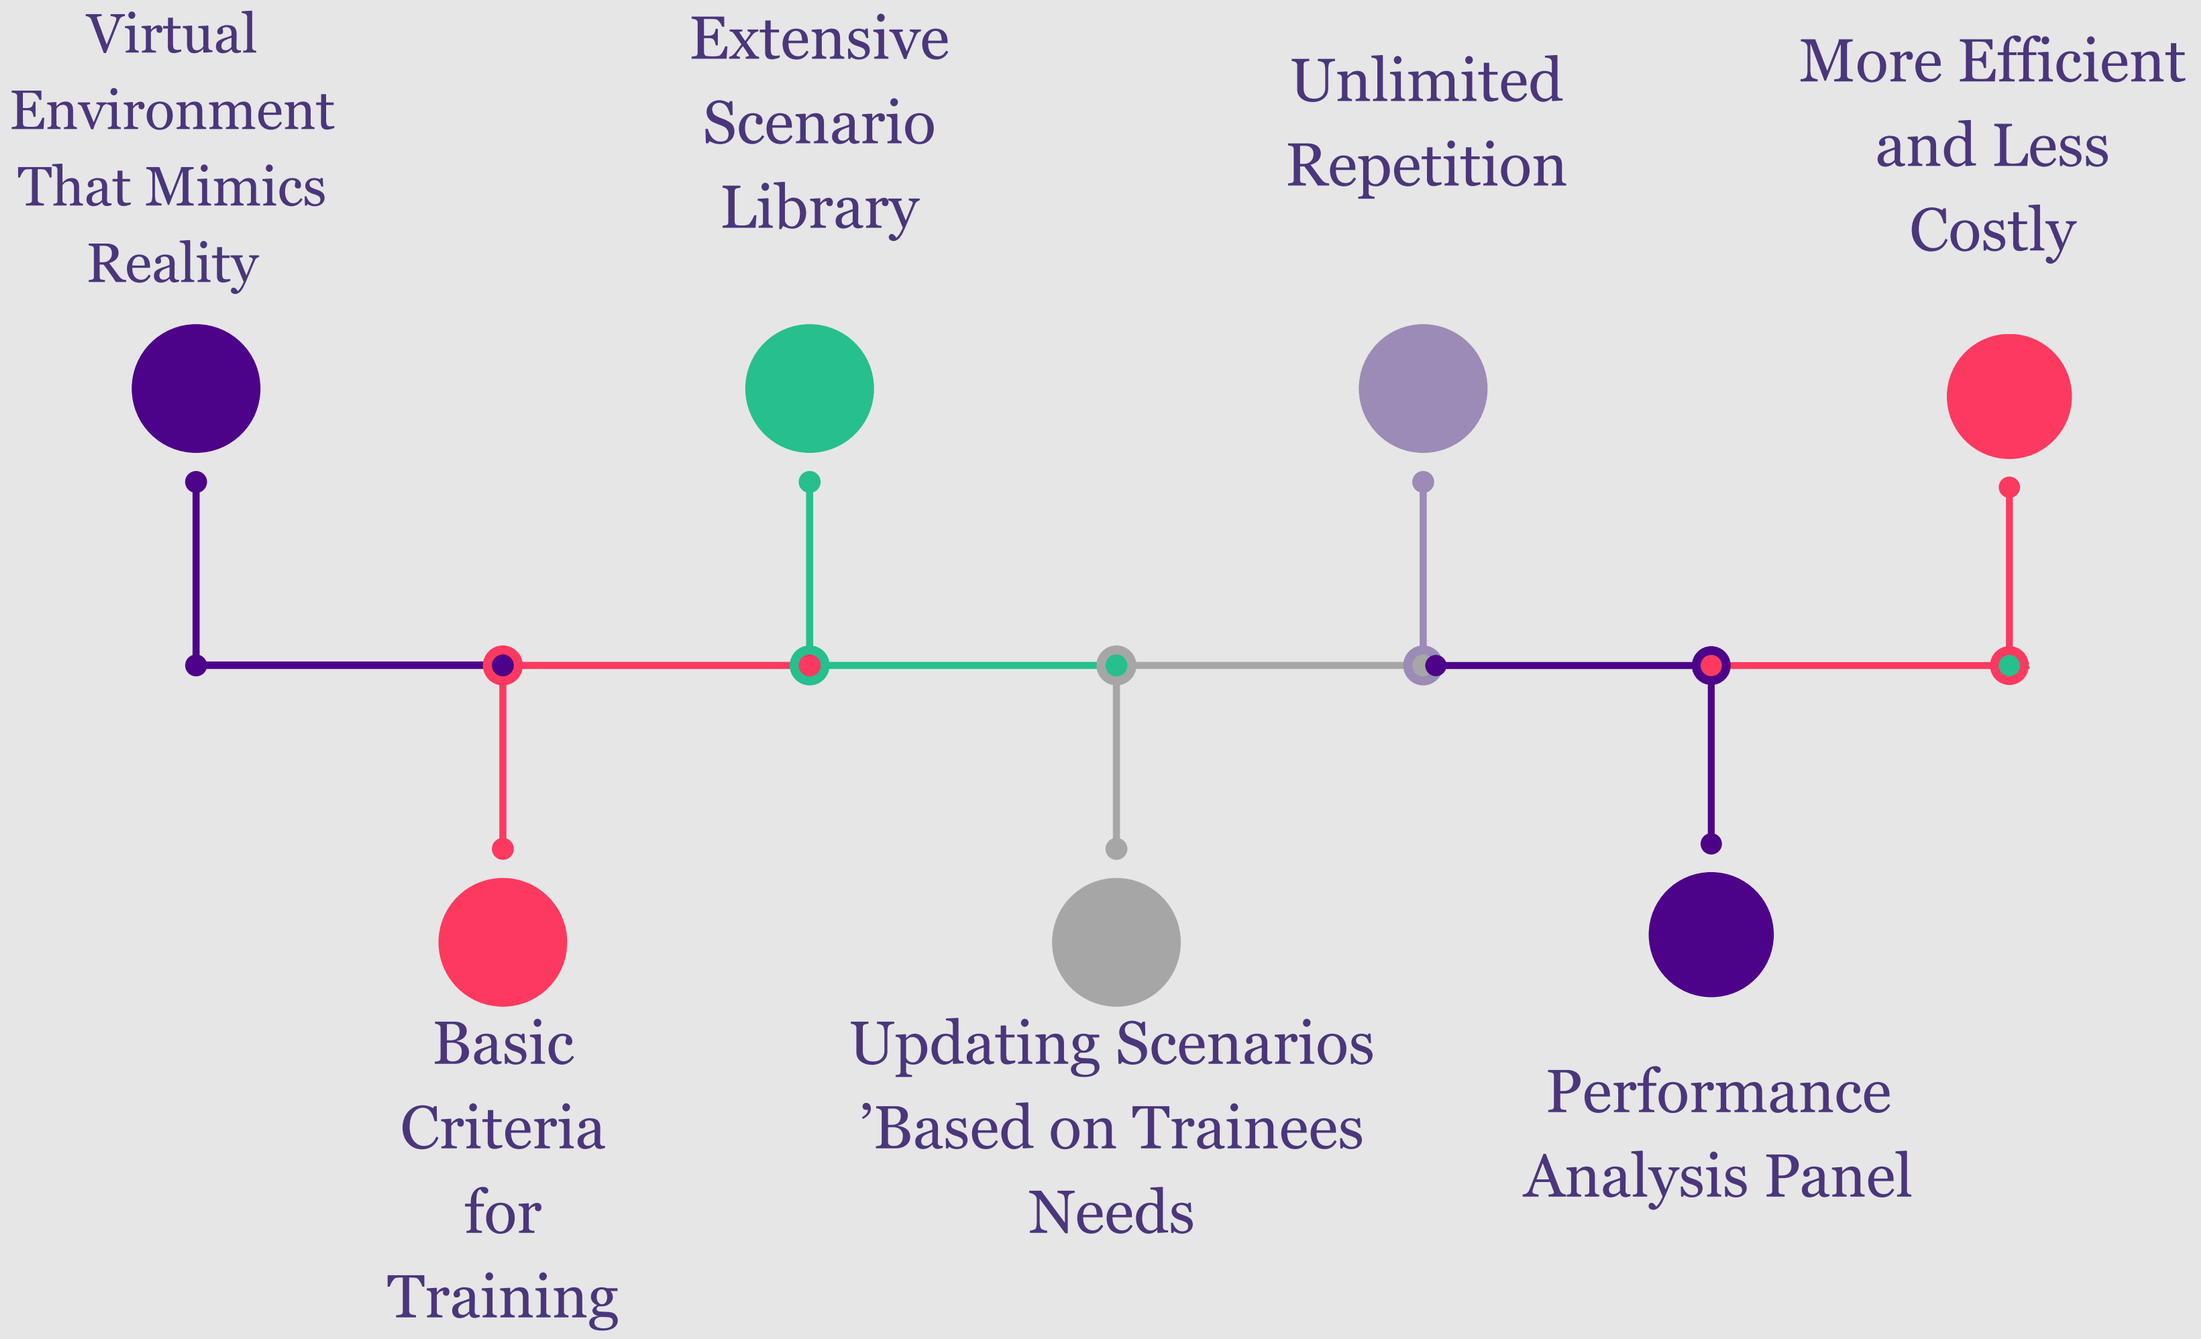

Arriving at the Solution:
Based on the analysis, the existing program is effective but resource-heavy, and trainees need more exposure and structured progression. VR addresses these needs by offering repeated practice, realistic and varied scenarios, ongoing updates, and safe exposure to stress, making it most effective as a complementary training tool rather than a replacement.

Example of a Global Company Using VR for Employee Training:

UPS

UPS uses VR for driver training, allowing employees to safely practice realistic road hazards and critical situations. This approach increased engagement, improved safety, and reduced overall training time. VR's proven effectiveness across various industries demonstrates that it can similarly enhance STC's customer-service training by improving readiness, confidence, and efficiency

Proposed IT Solution

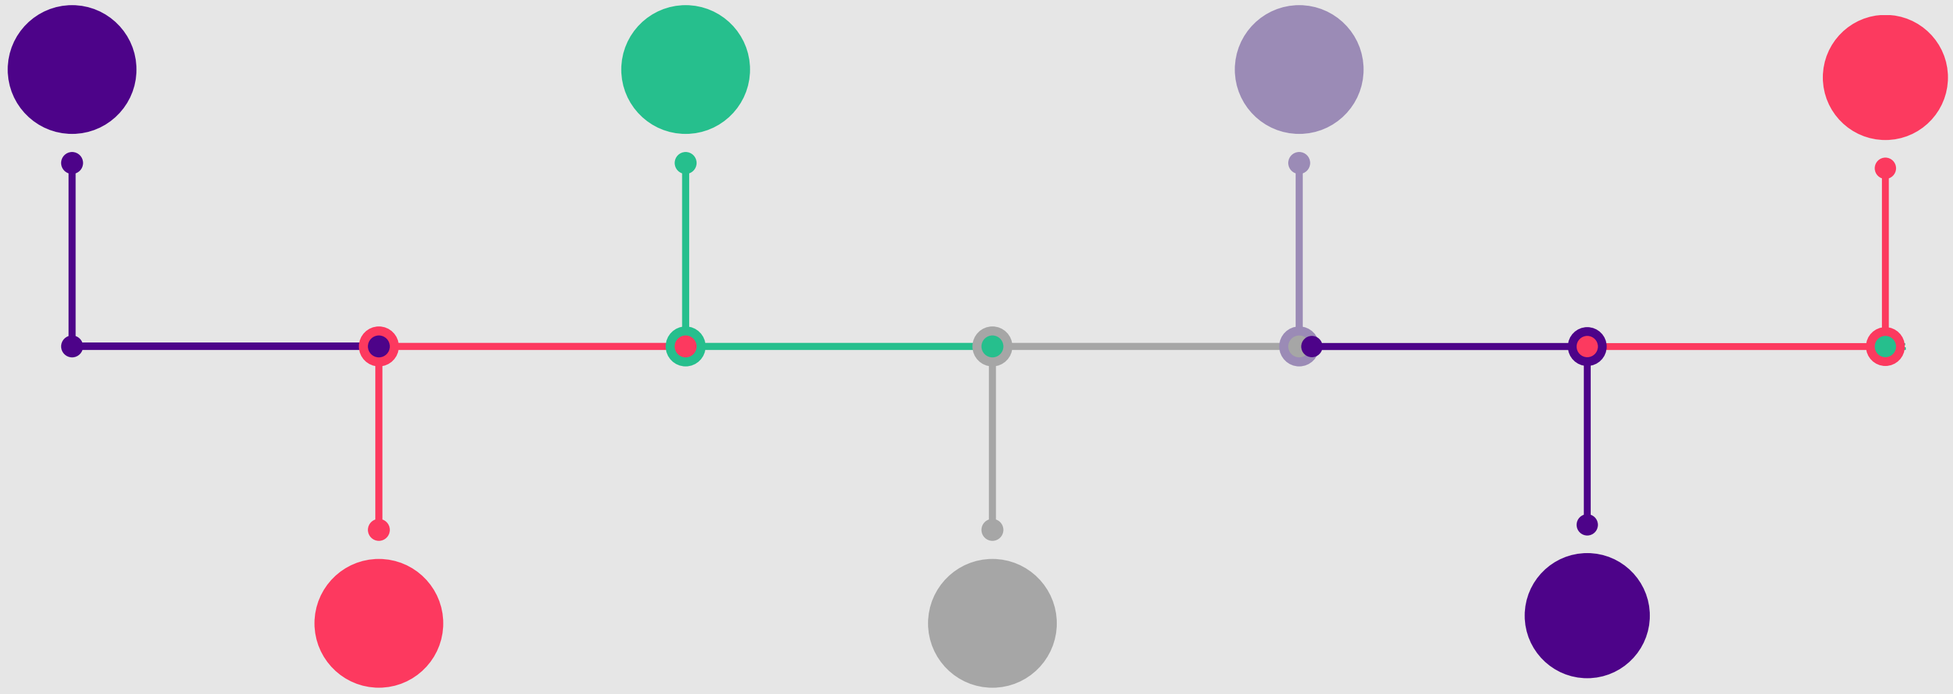

Virtual Environment That Mimics Reality
Extensive Scenario Library
Unlimited Repetition
More Efficient and Less Costly
Basic Criteria for Training
Updating Scenarios ’Based on Trainees Needs
Performance Analysis Panel

More Efficient and Less Costly

Provides more comprehensive training with less supervisor involvement compared to traditional methods.

Findings & Recommendations

Findings & Recommendations

Smart Adaptation of Scenarios

Enabling Unlimited Repetition to Simulate Real Work Conditions

Building a Large and Continuously Expandable Scenario Library

Smart Adaptation of Scenarios

Virtual reality adjusts training paths to each trainee’s needs, focusing more on areas that require improvement.

Enabling Unlimited Repetition to Simulate Real Work Conditions

Trainees can practice difficult scenarios as many times as needed, building confidence and readiness for real customer interactions.

Building a Large and Continuously Expandable Scenario Library

VR allows continuous addition of diverse scenarios, giving trainees exposure to various client types, cultures, and problem complexities.

Summary

STC’s current customer-service training is effective but limited by low scenario variety, reliance on actors, and lack of repeated or high-pressure practice. Survey and interview results confirm that trainees still struggle with stressful and unpredictable situations. VR offers a practical enhancement by providing realistic simulations, unlimited repetition, personalized learning, and reduced training time and cost. Using VR as a supporting tool—not a replacement—can significantly improve trainee readiness and overall customer satisfaction.

Suggestions

1. Enhance training with VR to improve realism and scenario variety.
2. Use progressive VR modules from simple to high-pressure situations.
3. Personalize training using VR performance-tracking features.
4. Integrate VR analytics into supervisor evaluation.
5. Update VR scenarios regularly based on evolving customer behaviors.
6. Train supervisors and L&D teams on managing the VR system.
7. Conduct a post-implementation cost-benefit evaluation.
